

Below is the description of my entire workflow:

1. Use the third-party large model integration platform <https://openrouter.ai/>
2. After logging in, click “Get API Key” on the home page to create own API key.

3. Top up balance and check the consumption logs.

4. Download the AOP-Smart project from GitHub <https://github.com/qinjiang-lab/AOP-Smart>.
5. Install Python on computer.
6. On a Windows computer, simply double-click Windows_Run.bat to run the program.
7. Enter the OpenRouter base URL: `https://openrouter.ai/api/v1`
8. Enter API key.
9. Enter question, then click “Run”. After execution, an `llm_history.txt` log file will be generated in the local folder.
